# GET LUCKY GOLF × SIMULATORS

*The fourth revenue stream — model, unit economics & adoption range · August 2026*

**The stream in one line.** The same insured hole-in-one challenge, delivered as software inside a simulator operator's platform: a $1 entry for a $1,000 insured prize, with the simulator itself as the verifier. No hardware, no cameras, no installation, no site cost. It is the fourth rung of the Get Lucky model, it goes live in 2027, and 20% of this round builds it.

REVENUE STREAM 4 — LAUNCHING 2027, FUNDED BY THIS ROUND

This document sets out the market it sells into, how the revenue is built, what the raise buys, and how the stream moves across its adoption range.

## Why simulators are in the plan, not beside it

The on-course product is capital-hungry by nature: cameras, installation, a revenue share with every course, and a sales cycle per venue. It buys legitimacy and the 66% gross margin that anchors the brand — but it does not scale past the courses the company can physically reach.

A simulator is the opposite. The venue already exists, the operator already owns the customer, and the machine already measures every shot to a tolerance far beyond what a course camera can achieve. Get Lucky supplies the one thing the operator does not have: an insured prize and the underwriting relationship behind it — the part that takes years to build and cannot be copied over a weekend. The integration is software, so the marginal cost of the ten-thousandth venue is the same as the first.

That is why this sits inside the model rather than beside it. The on-course business proves the product and pays for itself; simulators are how the same product reaches a market that is already built, already metered and already paying to hit shots — it simply has nothing to play for. By 2029 the stream carries roughly a quarter of group revenue on 1.5% of a single country.

## The market

| | |
|---|---|
| **Global simulator market** | ~$2.4bn (2025), projected to ~$4.8bn by 2035[1] |
| **South Korea** | ~94M simulator rounds a year[2] — nearly twice the traditional rounds played nationwide — across a $1.6bn screen-golf industry and ~9,000 venues[3] |
| **United States** | 19M Americans played exclusively off-course in 2025[4] |
| **Golfzon** | 6,500+ venues, ~60% of the global commercial simulator market[5] |

## Where it sells

**Golfzon** (lead target) · Trackman · Full Swing · Foresight Sports · X-Golf · Topgolf Swing Suite · Kakao VX

**The Ernie route to market.** Ernie Els has direct relationships with the operators on that list and opens the door himself — his standing in the game, his course-design network and The Els Club venues reach decision-makers an unknown start-up cannot. This is the single biggest reason to believe the channel is reachable at all. It is still direct access, not a contract, and the model treats it as such.

## Unit economics

| | |
|---|---|
| **Entry** | $1 per challenge, charged inside the operator's software |
| **Prize** | $1,000, fully insured — Get Lucky carries no prize risk, exactly as on course |
| **Split** | **46 / 30 / 24** — Get Lucky / operator / insurer |
| **Why 30% to the operator** | More than a course's 10%: the operator brings the venues, the software surface and the distribution, and Get Lucky installs no hardware and carries no site cost |
| **Insurance premium** | 24% of entry — held identical to the on-course model |
| **EBITDA margin** | **42%** on Get Lucky's share, struck after integration engineering, operator marketing support and platform operations — the stream is costed to be delivered, not assumed free |

## Volume — deliberately narrow

The forecast applies an attach rate to **South Korea's ~94M annual simulator rounds alone**[2] — Golfzon's home network. Golfzon's venues outside Korea, and every other operator named above, are excluded from the model entirely. If the channel works at all, it is unlikely to work only in one country; the plan does not ask an investor to believe that.

| Year | Attach rate | Paid challenges | Gross entries | Revenue to Get Lucky |
|---|---|---|---|---|
| **2026** | — | — | — | Integration year — no revenue modelled |
| **2027** | 0.3% | 282,000 | $282k | $130k · R2.4m |
| **2028** | 0.8% | 752,000 | $752k | $346k · R6.4m |
| **2029** | **1.5%** | **1,410,000** | **$1.41m** | **$649k · R12.0m** |
| **2032** | 4.0% | 3,760,000 | $3.76m | $1.73m · R32.0m |

FX 18.5. For scale: the 2029 figure is roughly 1.4 million $1 challenges across a network that logs 94 million rounds a year — about one challenge for every 67 rounds played.

## The stream inside the plan

Revenue is reported by stream so the composition of the business is legible at every milestone. Territory sponsorship — the signed Santam deal repeated with an anchor insurer partner per market — is set out in the Global Market Scenarios document.

| | 2026 | 2029 — 3-year plan | 2032 — exit vision |
|---|---|---|---|
| **Courses & app subscription** | R11.2m | R35.3m | R83.0m |
| **Simulators** | — | R12.0m | R32.0m |
| **Territory sponsorship** | — | R2.0m | R9.0m |
| **In-play upsells** | — | R4.3m | R10.5m |
| **Total revenue** | **R11.2m** | **R53.6m** | **R134.6m** |
| **EBITDA margin** | −6.3% | 15.5% | 23.9% |
| **Valuation milestone** | R53.3m | R147m | R807m |

2029 struck at 2.74× revenue — the multiple implied by the previously published milestone, not a new assumption. 2032 struck at 6× revenue.

## Adoption range — the 2029 milestone at three attach rates

| Attach rate | Simulator revenue | Total revenue | Valuation | Investor multiple |
|---|---|---|---|---|
| **0.5% — conservative** | R4.0m | R44.6m | R122.4m | 2.29× |
| **1.5% — the plan** | R12.0m | R53.6m | R147.0m | **2.76×** |
| **3.0% — strong adoption** | R24.0m | R67.0m | R183.8m | 3.45× |

Investor multiple measured on the R53.3m post-money of this round. Every figure here is live in the **Simulator** tab of the pro forma workbook in this dataroom: change the attach rate, the entry split or the Korea volume base and the whole model recalculates.

## What the raise funds

20% of the R8.0m — roughly R1.6m — is allocated to this channel: the operator-facing SDK and API integration, the verification and claims flow adapted to simulator shot data, the insurance product structured for a $1,000 prize at simulator ace rates, and the commercial and legal work of concluding an operator agreement. The remaining allocation is course expansion 20%, global platform 25%, market entry 20% and operations 15%.

## Principal risks

| | |
|---|---|
| **Operator agreements** | **No operator agreement is signed as at August 2026.** Simulator revenue depends on concluding one. Ernie Els' direct relationships with the target operators are how those conversations open, and the integration this round funds is what makes Get Lucky ready to sign; neither is a guarantee. The adoption range above shows how the milestone moves with take-up. |
| **Operator builds it in-house** | The defensible asset is the underwriting relationship and the claims infrastructure, not the challenge mechanic. An operator can copy the idea; replicating an insurer relationship and a verified-claims history is slower. |
| **Simulator ace rates differ from course** | Ace frequency on a simulator is materially higher than the ~1 in 12,500 amateur course rate, which is priced into the premium. If the premium required exceeds 24% of entry, Get Lucky's 46% share compresses. |
| **Regulatory treatment by market** | The product is skill-based and carries no gaming licence in South Africa. Treatment in Korea, the US and the EU requires local opinion before launch in each. |
| **Concentration** | The model is built on one country and effectively one operator. That is conservative as a volume assumption and concentrated as a commercial dependency. |
