GET LUCKY GOLF × INVESTOR FAQ

A golf day in your pocket · Founding round — R8.0m for 15% · August 2026

The round in one line. R8.0m buys 15% of Get Lucky Golf Club (Pty) Ltd at a R53.3m post-money valuation (R45.3m pre) — and Ernie Els invests in this round. Minimum tickets from R1m.

What is the product?

The fourball's money game, in an app. Build the bet slip on Thursday night — skins, nassau, dots, teams, with every player's strokes and maximum exposure stated — send it to the group chat, play with a live ledger, and settle on the 18th green, netted to the fewest transfers. On top of the peer game sits the one thing no scorecard app can offer: **a Santam-insured jackpot, group-pooled on the slip, from $1 → $500 up to $100 → $100,000.** Positioning in one line: the only money-game app with a $100,000 insured jackpot on the slip.

Is this gambling?

Two layers, two honest answers. **The peer games are the players' own money.** Private bets between players are lawful precisely while no third party takes a fee or holds the pot — so Get Lucky takes nothing and holds nothing, permanently. The app keeps score; the fourball settles the way it always has, by payment-app deep-link or the carry-forward ledger. **The insured challenge is a skill competition** — an entry fee to Get Lucky, a prize funded by its insurer, no pot and no counterparty — with a written legal opinion in the dataroom. A second counsel opinion covering the peer layer is a named milestone before launch, and Pride Mode (points only) is the default state in every market.

Why doesn't Get Lucky take a share of the pots?

Because the moment it does, the peer games stop being lawful private bets — in South Africa by statute, in the United States by precedent against a platform charging as little as 1%. Every durable competitor reached the same structure: the category leader charges a flat subscription and rakes nothing. Peer money in play (~$2.2m across 2029) is carried in the model as an engagement KPI with **revenue of zero, permanently**. Get Lucky earns from the $10/month subscription and the insured jackpot — never from the players' bets.

How does the money work?

Three layers. **Peer games — free.** No rake, no per-game fee, no wallet; settlement deep-links out. **The subscription — $10/month for the app:** games, live ledger, handicaps, season history. Creating games requires a subscription; invited players get the full experience for the round and the prompt after their first settlement — so every slip seats three future customers at zero acquisition cost. **The insured jackpot — per entry, group-pooled:** the fourball buys in together, any ace pays the group, four filmed swings on one designated hole. 24% of every entry is ceded as premium on the same swing that creates the risk; Get Lucky retains 66%.

What did the proof of concept prove?

That golfers engage. Twelve months: **10,000 paid challenge entries, 800 course-activation days, 60,000 members reached, 25 premium courses installed** on exclusive terms — and the money followed: R4.0m of revenue traded on R3.0m invested, R9m of Santam sponsorship contracted, and Ernie Els on the register. The on-course challenge is the proof and the flagship-jackpot estate; the app this round builds is the product.

What if someone actually wins the $100,000?

The insurer pays, and it is the best marketing day of the year. Every prize is 100% underwritten and camera-verified. On the submitted terms the weighted average entry is $17.00 against $4.08 of premium and $1.30 of expected claim — a **31.9% loss ratio**, with aces needing to run **2.51×** more often than amateur odds before the cover stops making money. Stress-tested for frequency, adverse selection and a full $100,000 claim in year one; the book stays in profit through all three. No revised policy is bound on these terms as at August 2026.

Who else does this? What's the moat?

Money-game apps exist — Skins App leads the category at $40/year flat; 18Birdies (10m+ golfers) runs points-only side games. **None of them can put an insured $100,000 on the slip.** That takes an underwriter, actuarial credibility, a claims process and verification infrastructure — all proven here over 10,000 entries. The moat is the jackpot layer, the Santam relationship, and 25 camera-rigged flagship courses, compounded by Ernie Els — who was 18Birdies' first official investor and chose to build this layer with us.

Isn't Ernie invested in a competitor?

He is a shareholder in 18Birdies — which is the point. It proved the category at 10m+ golfers, it runs its side games points-only, and it cannot underwrite a jackpot. Get Lucky is the layer that category cannot build; Ernie sits on both cap tables, which makes 18Birdies a natural partner or acquirer rather than a threat. And he backs this round with his own money.

What does the plan need to work?

7,398 paying subscribers by December 2029, building to 14,061 by 2032 — organizers of roughly 20,700 and 39,400 active players respectively, ramped from zero in January 2027. Growth assumes 12% → 9.5% → 8% gross monthly with churn at **5.5%/month — deliberately worse than the previous plan's 4%**, defended by group lock-in. Streams: subscriptions R4.4m → R14.2m → R28.1m; the insured jackpot (35% attach on slips at a $10 average ticket, net 66%) R2.8m → R9.2m → R18.2m; installed courses R1.5m → R3.5m → R6.4m; simulators nil → R12.0m → R32.0m; sponsorship R3.0m → R5.5m → R12.5m. Totals: **R14.1m** → **R44.4m** → **R97.2m**. Costs are budgeted line by line (verification charged on insured swings only — peer games verify themselves), giving EBITDA of 8.7%, 24.1% and 26.9%. Peak cumulative drawdown R2.3m against the R8m raise.

What is the biggest unknown — and how is it de-risked?

The jackpot attach rate on a group slip. It is modelled at 35% (20% sceptic, 55% bull) and has never been observed, because nobody has offered this product. So it gets measured before the app is finished:

a **90-day manual pilot across the 25 installed courses** — real slips, real jackpots, the existing camera rigs — reading slip creation, attach and average ticket. Above ~30% the plan is conservative; below ~15% the company course-corrects with the capital intact. Investors are invited to hold the company to this milestone.

What could my ticket become?

At the December 2029 milestone (R133.1m) a ticket marks at **2.50×** — an implied IRR of ~36% over the three years from January 2027. That is an unrealised mark on a private holding, not a realised return. 2032 lands at R291.6m (5.47×). Every forward milestone is struck at a **flat 3.0× revenue**; the round itself implies 3.77×, so the multiple compresses as the company scales. At 2.5× the 2029 mark is 2.08×; at 3.5× it is 2.91×. The full driver model is in the pro forma workbook.

How real is the simulator business?

Four mates in a sim bay is the perfect slip — and the machine measures every shot, so insured closest-to-the-pin works indoors, a format already validated commercially in the US. South Korea alone logs ~94M simulator rounds a year; Golfzon runs 6,500+ venues. R1.6m of this round builds the integration; the plan takes 1.5% of one country's rounds by 2029 (R12.0m) and counts no other market. Operator agreements are not yet signed and no approach has been made as at August 2026 — Ernie's relationships are the route in, and the dataroom models the adoption range.

What exactly am I buying in this round?

Raising	R8.0m (≈ $432k at FX 18.5)
Equity offered	15% of Get Lucky Golf Club (Pty) Ltd
Valuation	R45.3m pre-money · R53.3m post-money
Investing in this round	**Ernie Els** — founding shareholder, participating at this price
Minimum ticket	R1m (1.88%)
Use of funds (indicative)	App build (Cloud & Things) 35% · Pilot 10% · Simulators 15% · Market entry 25% · Legal & ops 15%
Technology partner	Cloud & Things — led by the former CTO of Capitec Bank
