GET LUCKY GOLF × INVESTOR FAQ

Founding round — R8.0m for 15% · August 2026

The round in one line. R8.0m buys 15% of Get Lucky Golf Club (Pty) Ltd at a R53.3m post-money valuation — the same stage as founding partner Ernie Els. Minimum tickets from R1m.

Is this gambling?

No. It is a purely skill-based competition — no randomness, no wagering, no odds-based payouts — so it sits outside gambling regulation and requires no gaming licence. Every prize is pre-funded and 100% underwritten by Santam (Authorised FSP 3416).

What happens if someone actually wins R1,000,000?

The insurer pays. Every prize is 100% underwritten by Santam. Installed courses verify with dual cameras plus an AI shot tracer; the global app verifies by shot video, course certificate and witness review, with most aces confirmed inside 24 hours. A big winner is the best marketing day of the year.

What has the company actually done?

Twelve months, July 2025 to July 2026:

- **10,000 entries** and **800 golf course activations** nationwide, reaching **60,000 members**.
- **25 premium courses installed**, on exclusive terms — with the top 100 courses live on the app.
- **R9m of contracted Santam sponsorship** over three years (R2.5m → R3.0m → R3.5m) — a floor, not a pipeline.
- **Ernie Els signed as founding partner** — equity, not endorsement.

How do the course partnerships work?

Courses earn 10% of every entry with zero upfront cost, on exclusive two-year auto-renewing agreements with restraint of trade; Get Lucky covers installation, insurance, technology and operations. The split of each entry is **66 / 10 / 24** — Get Lucky gross profit / course / Santam insurance.

How do the revenue streams fit together?

Four rungs, one product. **Installed courses** (dual cameras, physical entry board) anchor the brand at a 66% gross margin on every entry, with stakes from R50 → R25,000 up to R1,000 → R1,000,000. **Membership** at R149/month gives unlimited attempts across partner courses. The **global subscription** — $10/month for a $10,000 insured prize — scales to any par-3 on earth with no installation cost.

Simulators put the same $1 challenge inside operator software, where the machine does the verifying. Installs create legitimacy; the app and the simulators create reach, at no hardware cost.

Who else does this? What is the moat?

An always-on, permanently installed, verified hole-in-one platform is a world first; the only meaningful local competitor was acquired and rebranded into Get Lucky. The moat: exclusive locked-in course contracts, owned verification technology, a first-party platform and — the slowest piece for anyone to replicate — a live insurance relationship with a national underwriter, compounded by Ernie Els on the cap table.

What exactly am I buying in this round?

Raising	R8.0m (≈ $432k at FX 18.5)
Equity offered	15% of Get Lucky Golf Club (Pty) Ltd
Valuation	R45.3m pre-money · R53.3m post-money
Minimum ticket	R1m
Use of funds (indicative)	Course expansion 20% · Global platform 25% · Simulator integration 20% · Market entry 20% · Ops 15%
Founding partner	Ernie Els — founding shareholder, full name & likeness on the platform and the prize

What does the plan need to work?

9,720 subscribers by month 36, building to 22,886 by the 2032 exit — roughly 1% and 2% respectively of the company's own four-region launch scenario (US, EU, SA, JP: ~950,000 subscribers, $21m+/yr potential). The pro forma slows growth on purpose: 10.5% → 8% → 7% monthly with churn held at 4%. Courses and the app subscription build R11.2m (2026) → R35.3m (2029) → R83.0m (2032); simulators add R12.0m by 2029 and R32.0m by 2032; territory sponsorship adds R2.0m and R9.0m; in-play upsells add R4.3m and R10.5m. Totals: R11.2m → R53.6m → R134.6m. The plan is costed to be delivered: annual operating cost roughly doubles by 2029 (R5.4m → R15.2m → R27.1m), so 2026 runs at −R0.7m by design, reaching 15.5% EBITDA in 2029 and 23.9% in 2032. Revenue is reported by stream so the composition of the business is legible at every milestone. Prize payouts are excluded throughout — that risk is carried by the insurer.

What could my ticket become?

At the three-year plan (R187.4m) a ticket marks at **3.51×** — an implied IRR of ~52%. 2032 lands at R471m (8.8×). Every forward milestone is struck at a **flat 3.5× revenue** — 30% below the bottom of the 5–10× band engaged-community comparables trade at (Strava, Peloton, Whoop), discounted for being private and pre-scale. The round itself implies 4.77×, so the multiple compresses as the company scales; no multiple expansion is assumed anywhere. The full driver model is in the pro forma workbook, including the simulator adoption range on its own tab.

The round was R4.0m at R40m. Why is the price higher now?

Because the plan is bigger, and the return went up with it. Three revenue streams moved inside the model that were not there at R40m: **simulators**, the fourth rung of the product; **territory sponsorship** — the signed Santam deal repeated with an anchor insurer partner in each new market; and the **in-play upsell menu** that attaches to every rung. Together they lift the three-year milestone to R187.4m and 2032 to R471m, on a flat 3.5× revenue multiple. The net effect on an investor: **3.51× at three years and ~52% IRR, against 2.42× and ~34% at the old price.** The larger cheque is what funds the streams that produce the improvement.

How does sponsorship scale beyond South Africa?

It is the one line in the plan that has already been signed rather than forecast. **Santam committed R9m over three years** (R2.5m → R3.0m → R3.5m) to be attached to this product in South Africa — a market of roughly 150,000 golfers. The logic is structural, not promotional: the insurer who underwrites the prize is the natural sponsor of it, which is why the deal was signable in a small market and why it repeats in large ones. Each territory appoints its own anchor insurer partner at market entry. The model carries **the United States at R2.0m/yr from 2029 rising to R4.0m, Europe at R3.0m/yr from 2030 and Japan at R2.0m/yr from 2031** — every one of them set below the South African run-rate at entry, in markets many times its size. Those partners are appointed as each market opens and are not yet in place; the per-territory figures are live inputs on the Sponsorship tab of the workbook.

How real is the simulator business?

The market is already built — Get Lucky is not creating demand, it is monetising demand that exists. Simulators are a $2.4bn global market heading to $4.8bn; South Korea alone logs ~94M simulator rounds a year across ~9,000 venues, and Golfzon runs 6,500+ of them with roughly 60% of the commercial market. Those machines already measure every shot to a tolerance a course camera cannot match, so there is **no hardware, no installation and no site cost** — the simulator is the verifier. What the venues lack is something to play for, and that is precisely what Get Lucky supplies: an insured $1,000 prize and the underwriting relationship behind it, which is the slow part to build and the hard part to copy. Ernie Els holds direct relationships with every operator on the target list and opens those doors himself. R1.6m of this round builds the integration and the stream goes live in 2027, taking **1.5% of one country's rounds by 2029** — about one challenge for every 67 rounds played — and counting no other market and no other operator. Operator agreements are not yet signed; the adoption range and the commercial terms are set out in the dataroom and on the Simulator tab of the workbook.

What are the in-play upsells?

The menu sold **after** the entry, when a golfer has already paid and is standing over the ball — the most willing buyer in sport. Six items: a **jackpot upgrade** ($100 for a shot at $100,000 instead of the standard pot), **double up** ($5 to double the prize), **three swings for the price of two**, **nearest the pin** ($3 for a guaranteed prize inside three feet — which monetises the 12,499 shots in 12,500 that are not an ace), **the highlight reel** ($3 for the produced clip, no insurance component and therefore pure margin) and **the group pot** ($10 a head, closest to the pin takes it, Get Lucky takes a fee). Modelled at 12% attach on course and app attempts at $5 average, and 5% at $2 inside simulators where the base entry is a dollar; Get Lucky nets 55% at a 65% EBITDA margin. Because upsells attach to attempts already in the model, they never create new volume and cannot double-count another stream. **R4.3m by 2029, R10.5m by 2032.**

Does this get to a billion?

Not inside the modelled window, and the plan does not claim it does. The arithmetic past 2032 is straightforward: at the same flat 3.5× multiple, a R1bn valuation needs about **R286m of revenue** against the R134.6m modelled for 2032. Carrying the plan's own long-term growth rate — 1.8% monthly, the same rate already used to extend 2029 to 2032 — revenue passes that level roughly three and a half years later, putting **R1bn around 2036**. No new assumption is introduced and no multiple expansion is assumed. It is a horizon, not a milestone: the deal is priced against the R471m 2032 figure.

What is not in the plan?

Golf travel (targeting 200,000+ year-one app installs through trip-refund partnerships), cross-sport expansion, and every simulator venue outside South Korea sit entirely outside the plan you are underwriting — detail in the Global Market Scenarios document.
